

Quality Child-Caregiver Relationships as an Agent of Change?

Longitudinal Findings on the Social Skills of Yi Children
in Rural China

Background

Yi children are at-risk of negative development

Extreme Poverty

- 100 USD per year
- 20% extreme poverty

Parental Loss

- 10% lost 1 parent; 43% lost both
- Adopted or stranded

(Jiao, 2007; Li et al., 1999; Yang et al., 2007)

**Fu Hui Education Foundation
2006 - Present
1,300 Yi children**

Current Research: 31 month study, Yi children (6-8) entered in 2009

Research Aims

Overall

To understand risk and promoting factors associated with the social skills development of Yi children

- ✓ Psychological, behavioral health & academic success in adulthood (Aviles et al., 2006; Lynch et al., 2010)
- ✓ High levels of productivity of the region (OECD, 2010; Xu et al., 2016)

Specific Aims

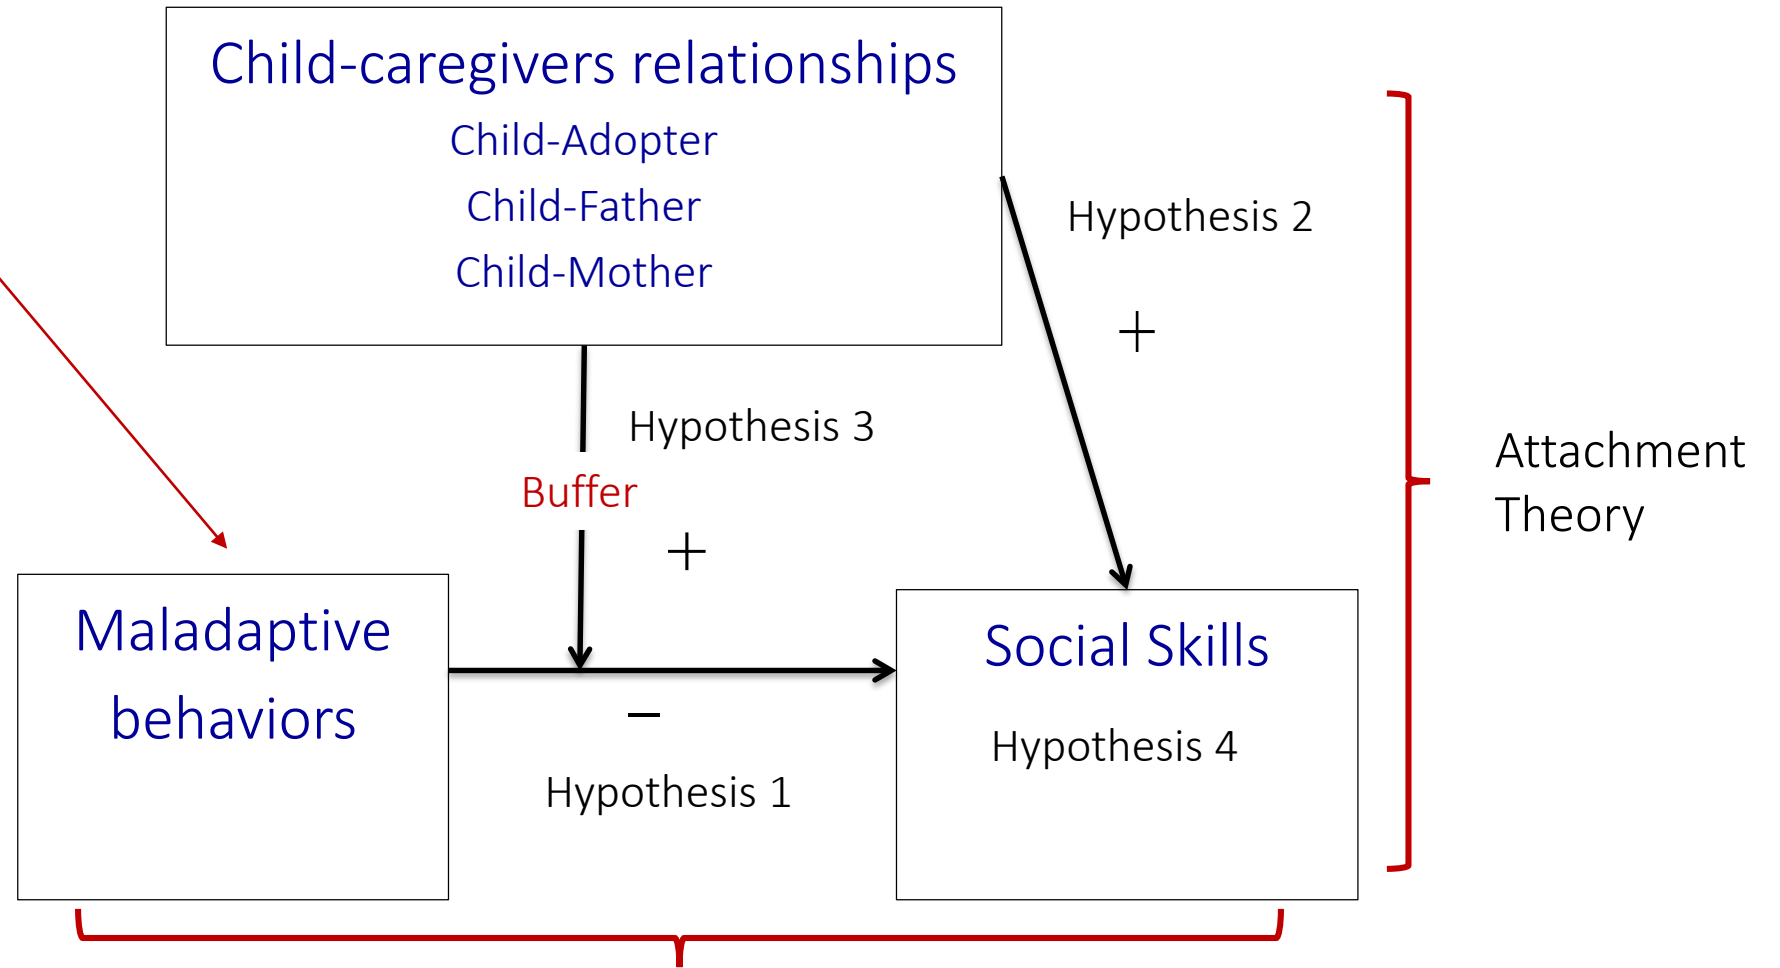

1. Negative effect of maladaptive behaviors on social skills
2. Promoting effect of children-caregivers relationships (child-adopter, child-father and child-mother) on social skills
3. Risk and Resilience: Social skills development of Yi children over time

Theories & Conceptual Framework

Parental Loss
Extreme Poverty

Developmental Psychopathology Approach

Risk and Resilience

Methods

Research Design

Longitudinal Quantitative Data (4 Waves; 31 months; 2009-2012)

All students (6-8 years old) entering program in year 09; n=328 participants

Multilevel Modeling (Slope varying model)

Main Effects

Level 1 (Social skills): $Social\ skills_{ij} = \beta_0j + \beta_1j(\text{time}) + \beta_2j(\text{Maladaptive Behaviors}) + r_{ij}$

Level 2 (Individual):

$$\beta_0j = \gamma_{00} + \gamma_{01}(\text{child-mother}) + \gamma_{02}(\text{child-father}) + \gamma_{03}(\text{child-adopter}) + \gamma_{04}(\text{Gender}) + \gamma_{04}(\text{Age}) + u_{0j}$$

$$\beta_1j = \gamma_{10}$$

$$\beta_2j = \gamma_{20}$$

Interaction Term

(Child-caregiver
relationships x
maladaptive behaviors)

Level 1 (Social skills): $Social\ skills_{ij} = \beta_0j + \beta_1j(\text{time}) + \beta_2j(\text{Maladaptive Behaviors}) + r_{ij}$

Level 2 (Individual):

$$\beta_0j = \gamma_{00} + \gamma_{01}(\text{child-mother}) + \gamma_{02}(\text{child-father}) + \gamma_{03}(\text{child-adopter}) + \gamma_{04}(\text{Gender}) + \gamma_{04}(\text{Age}) + u_{0j}$$

$$\beta_1j = \gamma_{10}$$

$$\beta_2j = \gamma_{20} + \gamma_{21}(\text{child-mother}) + \gamma_{22}(\text{child-father}) + \gamma_{23}(\text{child-adopter}) + u_{1j}$$

Measurements

Time-varying outcome variable (Social Skills)

Self-designed teacher-reported social skills scale (5 items; CFI/TFI=0.98; $\alpha>.80$); all 4 data waves

Time-varying predictor (Maladaptive behaviors)

*Self-designed teacher-reported maladaptive behaviors (5 items; CFI/TFI>0.98; $\alpha>.80$);
3 categories (High; Medium; Low); all 4 data waves*

Time-invariant predictors (Child-caregivers relationships)

*Child-adopter self-reported relationships (Single Item); baseline
Child-mother self-reported relationships (Single Item); baseline
Child-father self-reported relationships (Single Item); baseline*

Covariates

Gender & Age

Results

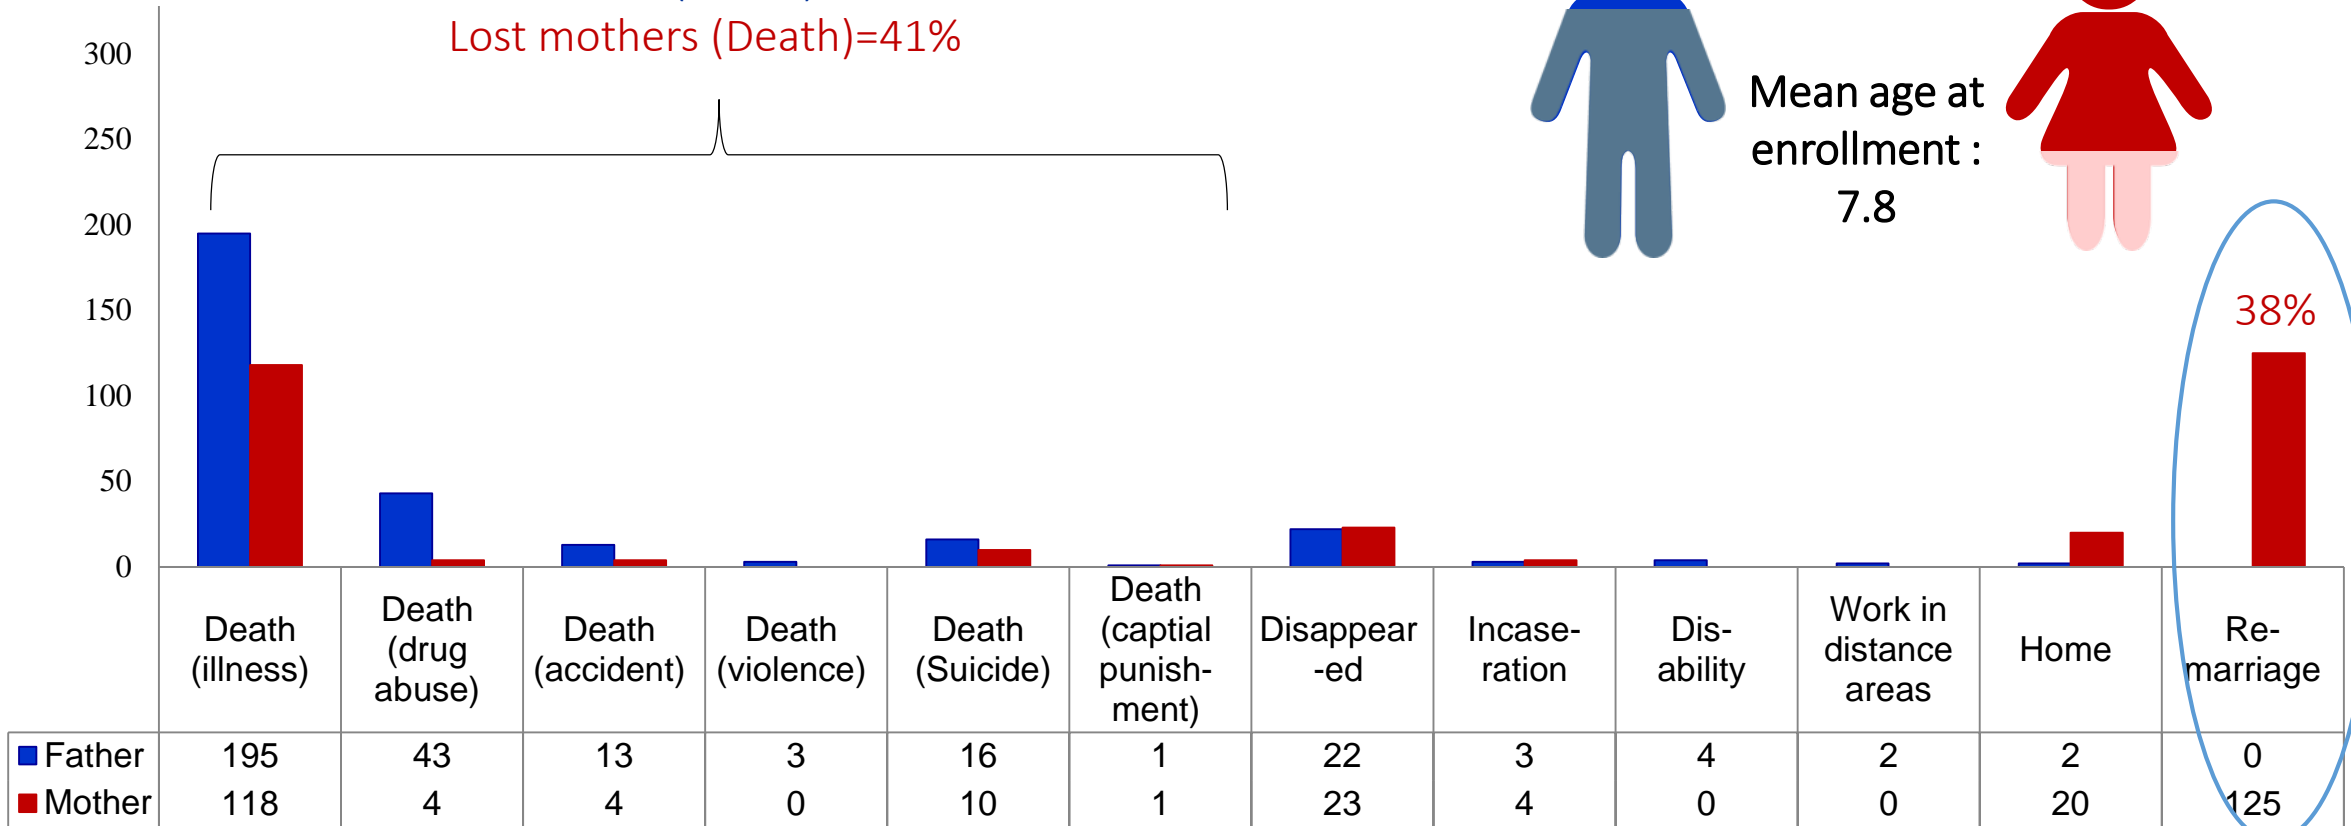

Descriptive

Number of Responses

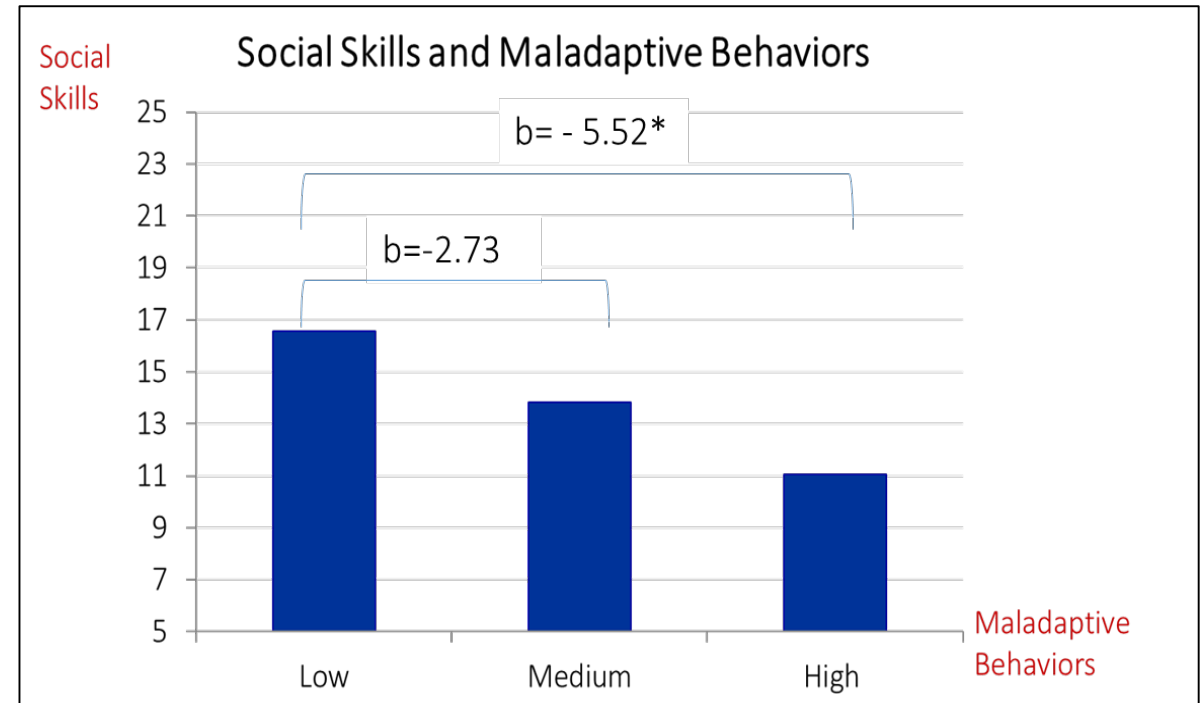

Lost fathers(Death)= 84%
Lost mothers (Death)=41%

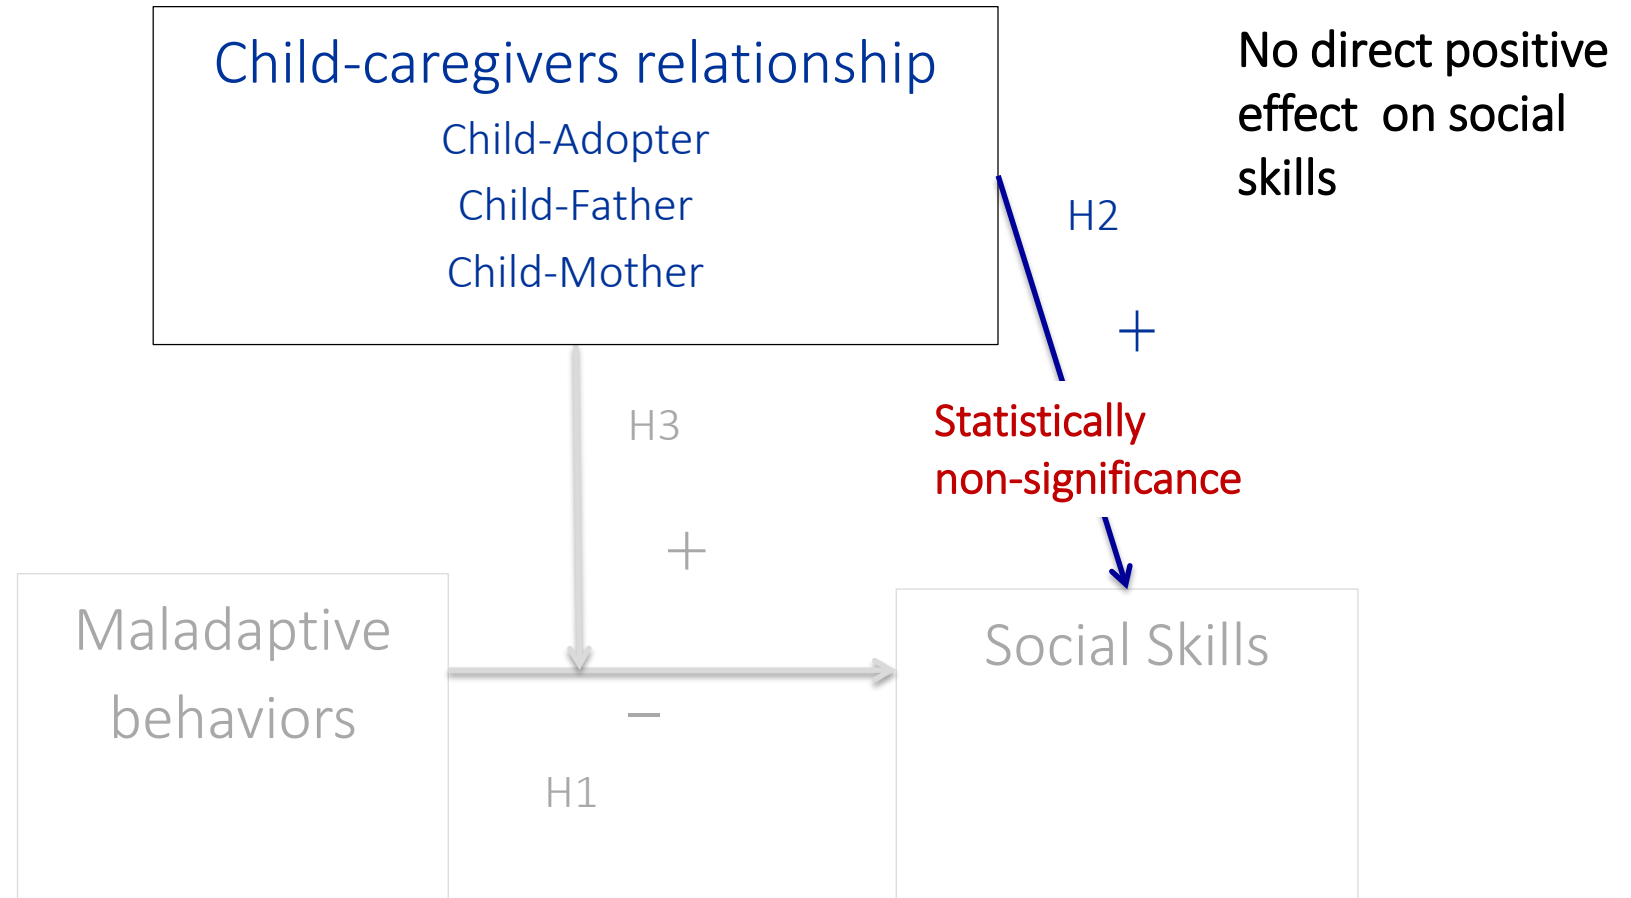

Mean age at enrollment : 7.8

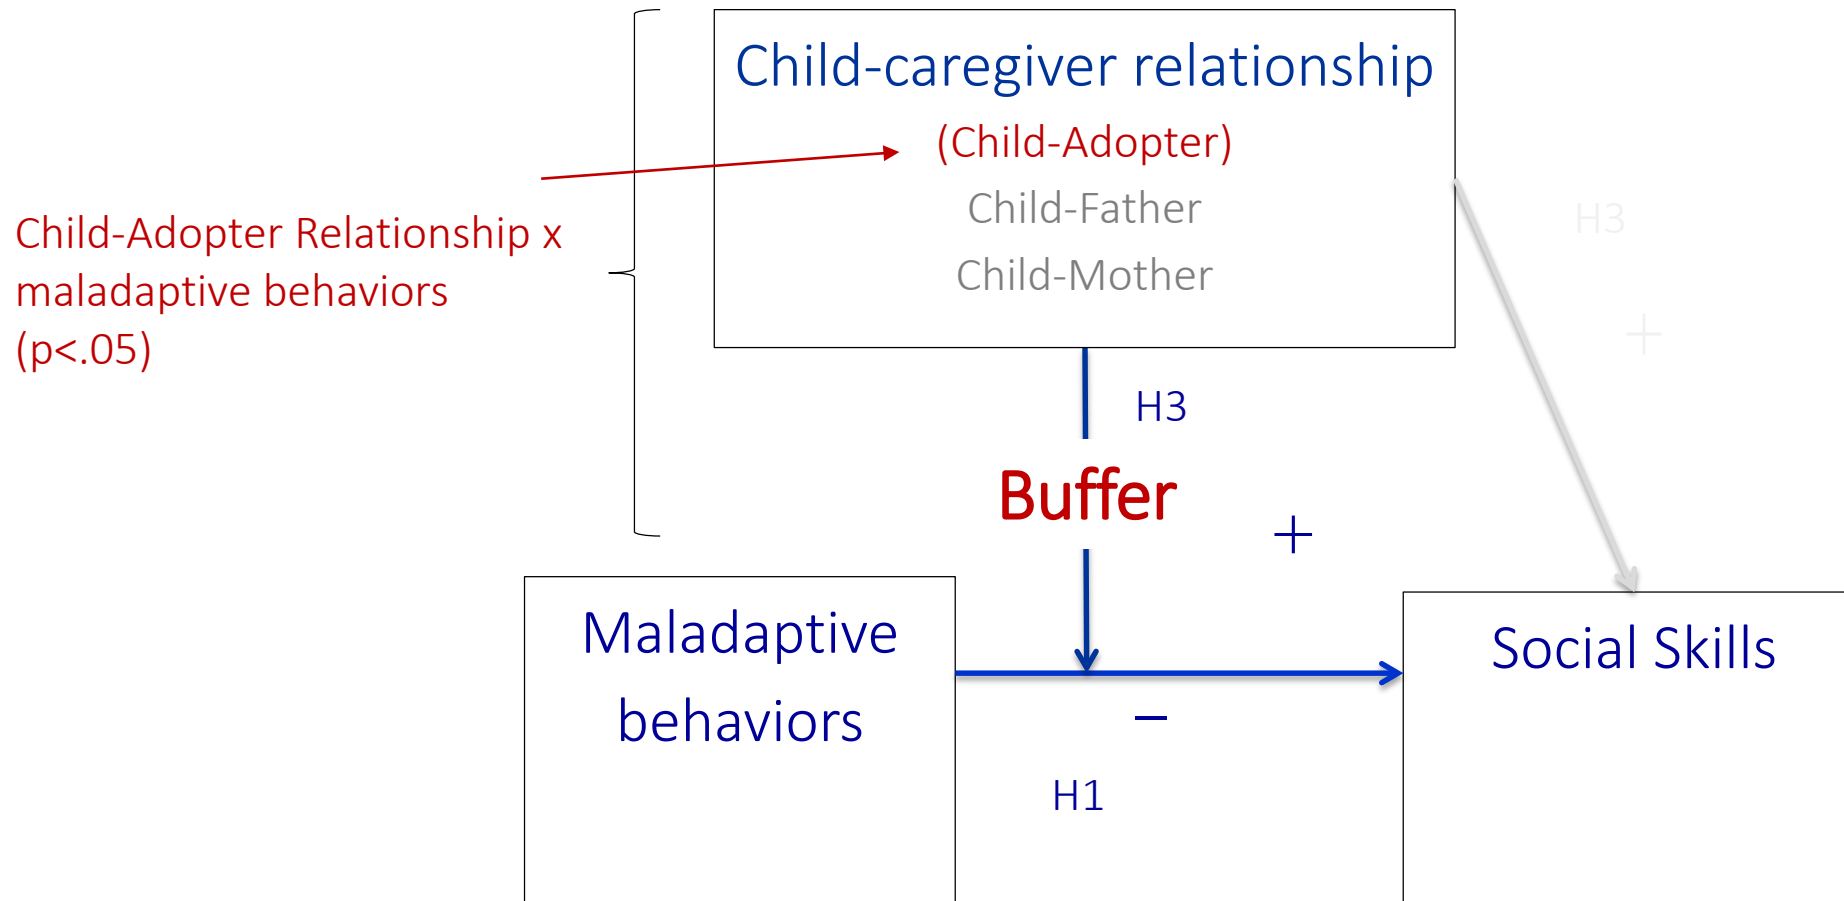

Multilevel Model: Negative effect of maladaptive behaviors

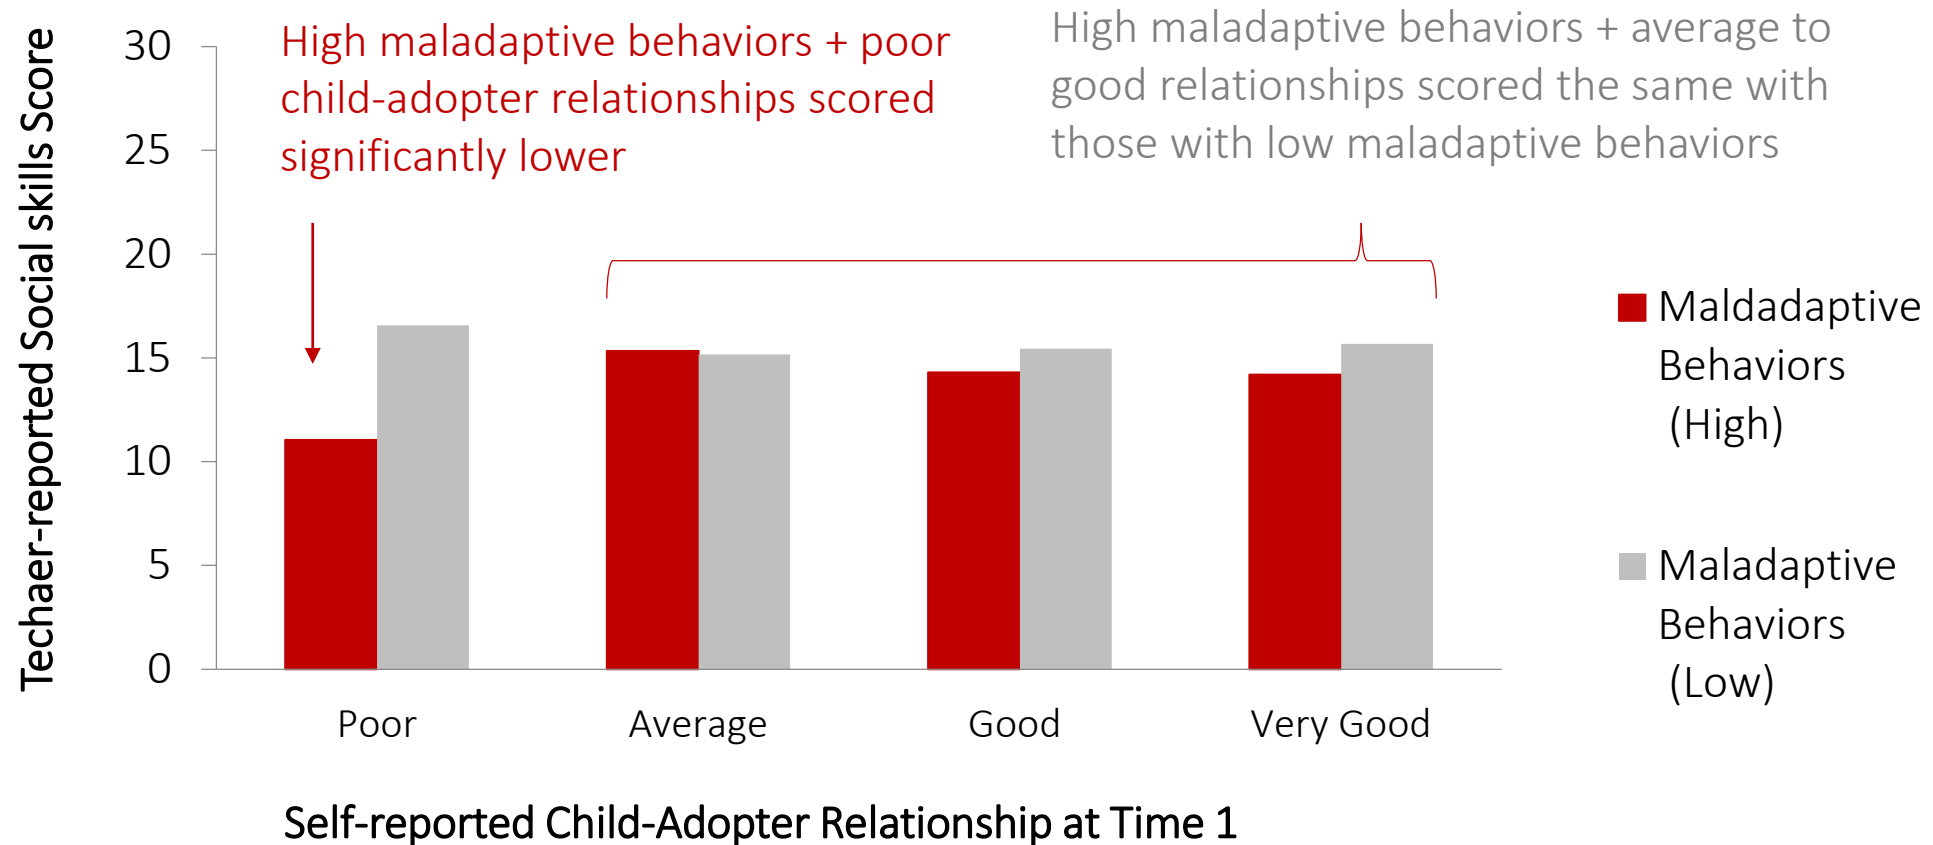

Multilevel Model: Effect of Child-Caregivers Relationship

Multilevel Model: Buffering effect of good child-adopter relationships for high risk Yi children

Multilevel Model: Buffering effect of good child-adopter relationships for high risk Yi children

Multilevel Model: Social skills improve over time

Discussion

Key Findings

1. Maladaptive behaviors has a negative effect on social skills of Yi children
2. Having average to good child-adopter relationships buffer the negative effect of maladaptive behaviors on social skills.
3. Social skills of Yi children improve over time.

Innovation & Significance

Use of Strength based approach vs deficit approach

- ✓ “Redefine” on Yi children : Are they at risk? Problematic? Nothing good in them?
- ✓ Identify strengths : Yi children can thrive

Preventive approach vs. problem solving approach

- ✓ Mobilize existing familial resources associated with future positive development
- ✓ Developmental trajectory of Yi Children can be altered (POSSIBILITY)

Strengths & Limitations

Strengths

1. Longitudinal data
 - Predictive effect of child-adopter relationship (baseline) on social skills development
 - Multilevel model : Allow the modeling of change patterns even for data collected at uneven time points
2. Solid theoretical Foundation
 - Risk and Resilience
 - Developmental Psychopathology
 - Attachment Theory

Limitations

1. Fail to capture the effect of parental loss and extreme poverty on maladaptive behaviors
2. Single item measurement (child-caregiver relationships)
3. Common method bias
4. Effect of age on social skills

So What?

Practice implications

- Programs do not necessarily need to target at changing individuals behaviors, rather focus on altering external environment to facilitate change.

Research implications

- Conduct randomized control trails to examine the positive effect of child-caregiver program on Yi children.
- Large scale research to test the generalizability of the proposed framework on youths of other ethnic minority groups in rural China.

Policy implications

- Government to invest in promoting positive familial relationships of Yi children for positive change
